N/A Visit the guide Disclaimer: Kaggle has no affiliation or endorsement with this project or developer. The Kaggle Notebook is a simple way to create and deploy notebooks that run locally. While notebooks can be created using any notebook-like application, this project was built to solve a specific problem: You're writing a blog post, maybe you've already created the notebook for it. You might even be halfway done but find yourself needing to save your progress. You're looking for a way to run the code you've written in the notebook without waiting for the notebook to deploy. The problem with running a notebook online is that you can't easily access the results. In this situation, you're better off waiting until you're done and then just taking

---

the results and sharing them on social media or wherever. Kaggle Notebook isn't a complete solution for the problem. It's just an extension of the free Kaggle Notebook application. The goal of this project is to show how to combine this application with Kaggle to create a small version of a full notebook instance for your own personal use. Getting started with Kaggle Notebooks It's easy to start writing code in a notebook. Just like a regular notebook, you can use either Markdown or LaTeX to write your code. However, the Kaggle Notebook is different than a regular notebook. It uses a special notebook format that allows the code you write to run without deploying the notebook. In addition, the notebook allows you to share your code with Kaggle users to see if anyone can write more python code to solve your problem. If you want to run the code you write locally in the notebook, you can use the Run feature. To view the results of your code, you can add some simple output display commands to your notebook. The figure below shows the finished notebook. Notebooks can easily be created using any notebook-like application, such as Jupyter Notebook or Pypi Notebook. However, in order to run the notebooks we want to create, we're going to use Kaggle's Notebook application. Installing Kaggle Notebook The easiest way to get Kaggle Notebook is to use the Kaggle Notebook application on Github. Getting the application is easy. Just click on the Kaggle Notebook link on the 82157476af
